The training program on "THE SITE - IT'S RELEVANCE TO THE DESIGN" are helpful for all Architects and students A site visit is the first step in any design process. Many times, the understanding stance of this step is overlooked. Architects are often expected to start working on a building design by just looking at site survey plans and site pictures or videos.

There are several things that visiting the site can offer that you cannot see, experience, or understand from photographs It deals with climate, topography, geology, hydrology, vegetation as well as social, cultural, ecological, and environmental aspects.

As a renowned architect, Tadao Ando says, "You cannot simply put something new into a place. You have to absorb what you see around you, what exists on the land, and then use that knowledge along with contemporary thinking to interpret what you see".

The importance of the process of designing with relevance to the site. the site plays a huge role in influencing building orientation, massing, and the materials chosen for construction. We also need to understand that for a design to be holistic, it needs to be responsive to its surroundings. This could also be the reason why principles of vernacular architecture and critical regionalism are valid and relevant even today as they underline the idea of creating harmonious design with the geographical context of the building

The main objective of these 5 days' programs is to make understand the process of designing with relevance to the site.
